

USER GUIDE

Admin User Guide

System administration: accounts, access, configuration, security and backups

WHO THIS GUIDE IS FOR

Administrators who hold the keys to the system. Read the security rules in this guide before you use them.

WHAT YOU ARE ACCOUNTABLE FOR

- Create, maintain and disable user accounts
- Assign roles on the principle of least privilege
- Configure business, document numbering and approval settings
- Review the audit log and privileged accounts regularly
- Run and verify backups
- Supply role guides to staff who need training

How to use this guide

Work through the chapters in order the first time. After that, use the contents list below to jump straight to the task you need. Every instruction names the exact menu path and the exact button label you will see on screen.

A typical day in this role

- 1 Daily — password reset requests and new account requests, each verified before you act.
- 2 Weekly — Security Centre review: privileged accounts, failed sign-ins, unusual activity.
- 3 Monthly — backup verification and a review of who holds which role.
- 4 As needed — configuration changes, always with a stated business reason.

Contents

1.	Signing in for the first time	Sign-in screen
2.	Finding your way around	
3.	Your profile and personal details	Overview > My Profile
4.	Notifications and notes	Overview > Notifications / Notes
5.	User accounts	Administration > User Management
6.	Roles and permissions	Administration > Roles & Permissions
7.	System and business settings	Administration > System Settings / Business Settings
8.	Security centre and audit logs	Administration > Security Centre / Audit Logs
9.	Backup and recovery	Administration > Backup & Recovery
10.	Employee records	Human Resources > Employees
11.	Master data	Master Data
12.	Accounting configuration	Accounting Configuration
13.	Reports	Reports & Analytics > Reports
14.	Getting help	

1

Signing in for the first time

Where to find it: [Sign-in screen](#)

Get into the system safely and know what to do when the password does not work.

Sign in

Your account is created for you by an administrator — you cannot register yourself.

1 Open the system link supplied by your supervisor.

Use the same link every time. Save it as a bookmark on the device you work from.

2 Type your identifier in the first box.

Any one of these works: your work email, your username, your employee number (for example EMP-0001) or your registered phone number.

3 Type your password in the second box.

Tap the eye icon on the right of the box if you want to check what you typed.

4 Press Sign in to workspace.

5 Change the temporary password the first time you sign in.

Go to My Profile > Change password and set a password only you know.

If you have forgotten your password

1 On the sign-in screen, click Forgot password?

2 Enter your email, username, employee number or phone number and submit the request.

3 Wait for the administrator to action the request.

Password requests appear in the administrator's Password Resets inbox. They will give you a new temporary password.

4 Sign in with the temporary password, then change it immediately.

IMPORTANT

Never share your password or let someone else work under your login. Every action is recorded against the account that performed it, so anything done under your login is treated as done by you.

Common questions

It says my details are wrong but I am sure they are right.

Check that Caps Lock is off and that there is no space at the end of what you typed. If it still fails, use Forgot password? — repeated wrong attempts can lock the account.

My account says suspended.

An administrator has disabled the account. Contact your supervisor or HR; only an administrator can reactivate it.

2

Finding your way around

Understand the screen layout so you can reach any task quickly.

The three parts of every screen

- Left sidebar — the menu. Items are grouped (Overview, Attendance, Leave, Documents and so on). Click a group to open it, then click the screen you want.
- Top bar — search, notifications bell, and your profile picture. Your name and current role are shown here.
- Main area — the screen you selected. Most screens start with a heading, a short description, and buttons for the main actions on the right.

RULE

You only see the menu items your role is allowed to use. If a colleague has a menu item you do not have, that is by design — ask your supervisor if you believe you need access.

Things that work the same on every screen

- Filters sit above lists — narrow by date, status, department or branch, then click Clear to reset.
- Lists are paged. Use Prev and Next underneath the table to move through the records.
- Where an export is allowed, you will find Export CSV (for spreadsheets) or Download PDF (for printing and filing).
- A green message at the bottom of the screen confirms a save; a red message means nothing was saved and explains why.

TIP

The system works on a phone as well as a computer. On a phone, the menu is behind the button in the top-left corner.

3

Your profile and personal details

Where to find it: [Overview > My Profile](#)

Keep your own record correct — payroll, HR and emergency contact all depend on it.

What is on your profile

- At a glance — your photo, employee number, department, branch and job title.
- Contact — phone, email and address.
- Emergency contact and medical information — blood group, allergies, chronic conditions and notes used in an emergency.
- Banking details — the account your salary is paid into.
- Documents centre — copies of your ID, certificates and permits.
- Activity timeline — a record of changes made to your profile.

Update your details

- 1 **Open Overview > My Profile.**
- 2 **Find the section you need to change and click into it.**
- 3 **Type the new information.**
- 4 **Click Submit for approval.**
Changes are not applied immediately. HR reviews them first, which protects payroll and statutory records from mistakes.
- 5 **Watch your notifications for the outcome.**
HR can approve the change, reject it, or ask you for more information. Rejected changes tell you why.

Change your password

- 1 **Open Overview > My Profile.**
- 2 **Click Change password.**
- 3 **Enter your new password, confirm it, and save.**

IMPORTANT

Banking detail changes are treated as sensitive. Expect HR or Finance to confirm the change with you before it takes effect — that check exists to stop salary fraud.

4

Notifications and notes

Where to find it: [Overview > Notifications / Notes](#)

Never miss an approval, a payslip or a request that is waiting on you.

Check your notifications

- 1 **Click the bell in the top bar, or open Overview > Notifications.**
- 2 **Use the Unread tab to see only what you have not read yet.**
The All tab keeps the full history.
- 3 **Click a notification to jump straight to the screen it refers to.**
A leave notification opens Leave, a payslip notification opens Payroll, and so on.
- 4 **Mark items as read once you have dealt with them so your list stays clean.**

Notes

- Overview > Notes is your private notepad — nobody else can see it.
- Give a note a title, content, a colour and tags so you can find it again.
- Use it for handover reminders, shift notes and anything you would otherwise write on paper.

5

User accounts

Where to find it: [Administration > User Management](#)

Create logins, assign roles, and shut off access the day someone leaves.

Create a user account

- 1 **Confirm the employee record already exists under Human Resources > Employees.**
- 2 **Open Administration > User Management.**
- 3 **Click Create user account.**
- 4 **Link it to the employee and set the sign-in details.**
An employee with no email address can still sign in with a username, employee number or phone number.
- 5 **Generate a temporary password and give it to the person directly.**
Never send a password in a group chat, and tell them to change it at first sign-in.
- 6 **Assign the roles the job actually requires.**
Start with the minimum. It is easy to add a role later and hard to undo what was done with an unnecessary one.
- 7 **Save, and confirm the account shows as Active.**

Change what someone can do

- 1 **Find the user on Administration > User Management.**
- 2 **Click Manage user, then Edit roles.**
- 3 **Add or remove roles, and save.**
- 4 **Tell the person what changed.**
Their menu will change at their next sign-in, and unexplained changes generate support calls.

When someone leaves

- 1 **Suspend the account on the day they leave — not at the end of the month.**
- 2 **Revoke their active sessions so any signed-in device is signed out.**
- 3 **Confirm with HR that the employee record is updated.**
- 4 **Do not delete the account.**
Their historical actions must remain attributable for audit purposes.

Reset a password

- 1 **Open Administration > Password Resets to see requests waiting.**
- 2 **Verify who you are talking to before you reset anything.**
Phone them on the number on their employee record, or deal with them in person. Pretending to be a colleague who is locked out is the oldest attack there is.
- 3 **Reset the password and give the temporary one to the verified person.**

RULE

Every administrator action is logged with your name against it. Work as if the audit log will be read — because it will be.

6

Roles and permissions

Where to find it: [Administration > Roles & Permissions](#)

Control what each role can see and do, from one matrix.

Review a role

- 1 **Open Administration > Roles & Permissions.**
- 2 **Find the role in the permission matrix.**
- 3 **Read across the row to see every permission that role holds.**
- 4 **Change a permission only with a stated business reason.**

A permission change affects every person holding that role, not just the one who asked.

IMPORTANT

Separation of duties is what protects the business: the person who creates a supplier should not approve it, and the person who runs payroll should not approve it. Do not collapse those roles onto one person because it is convenient.

7

System and business settings

Where to find it: [Administration > System Settings / Business Settings](#)

Configure the system once, correctly, so every module behaves consistently.

What you configure where

- Business Settings — fiscal calendar, tax, currency, locale and operating defaults.
- System Settings — branding (including the logo), and system-wide behaviour.
- Document Numbering — the reference format for every document the business issues. Numbers are allocated by the database, so concurrent users never get duplicates.
- Approval Workflows — who approves each transaction, in what order, and what happens when an approval stalls.
- Receipt Template — what prints on POS receipts: logo, header and footer text, tax fields and paper size.
- Office Locations — the sites used for attendance geofencing.
- Notification Centre — the system messages that go out.
- Integrations — connections to outside services.

IMPORTANT

Change document numbering formats only between periods, never mid-sequence. Changing a format mid-month makes documents hard to trace and reconcile.

8

Security centre and audit logs

Where to find it: [Administration > Security Centre / Audit Logs](#)

Watch for the things that should not be happening.

A weekly security check

- 1 **Open Administration > Security Centre and review Privileged accounts.**
- 2 **Confirm every administrator still needs to be one.**
Privileged access accumulates quietly. Remove what is no longer justified.
- 3 **Open Administration > Audit Logs and filter to the past week.**
- 4 **Look for the patterns that matter.**
Out-of-hours activity, repeated failed sign-ins, bank detail changes, permission grants, and reopened till sessions.
- 5 **Follow up anything unexplained with the person who did it, the same week.**

9

Backup and recovery

Where to find it: [Administration > Backup & Recovery](#)

Make sure the business can recover its data.

Run and verify a backup

- 1 **Open Administration > Backup & Recovery.**
- 2 **Click Run backup.**
- 3 **Confirm the backup completed and note the date and time.**
- 4 **Test a restore periodically in a safe environment.**
A backup nobody has ever restored is a hope, not a backup.

10

Employee records

Where to find it: [Human Resources > Employees](#)

Create and maintain the master record every other module depends on.

Find an employee

- 1 Open Human Resources > Employees.
- 2 Search by name or employee number, or filter by Department, Branch or Role.
- 3 Click the row to open the full record.

Add a new employee

- 1 On Human Resources > Employees, start a new employee record.
- 2 Complete the personal details: full name, date of birth, gender, national ID and contact details.
Spelling must match the national ID exactly — payroll and statutory returns use this name.
- 3 Complete the employment details: department, branch, job title, employment type, hire date and reporting manager.
- 4 Capture the address and emergency contact.
- 5 Save the record.
- 6 Ask an administrator to create the system login.

An employee record and a login are two different things. Until the administrator creates the user account in Administration > User Management, the person cannot sign in.

What lives on an employee record

- Personal snapshot — identity, contact and emergency details.
- Employment — department, branch, title, manager and employment type.
- Salary structure — basic pay, allowances and recurring deductions (Finance maintains this).
- Documents — verified IDs, certificates and permits.
- Leave and attendance history.

IMPORTANT

Never re-use an old employee record for a new starter. Create a new one, or historical pay, leave and attendance will be attributed to the wrong person.

11

Master data

Where to find it: Master Data

Maintain the shared lists every other module reads from.

The master data screens

- Product Master — the single catalogue of everything the business buys and sells.
- Categories — one category tree shared by inventory, procurement, sales and accounting.
- Brands and Manufacturers — reference lists used by products.
- Units of Measure and Unit Conversions — how you buy, stock and sell each item (box to piece, pallet to bag).
- Tax Categories — the tax treatment applied to a product.
- Price Lists — the prices sales and POS use.

- Product Attributes — the variations such as 32mm / 40mm or matt / gloss.
- Cost Centres — how costs are attributed for reporting.

Add or change a master data record

Every master data screen works the same way.

- 1 **Open the screen from the Master Data group in the menu.**
- 2 **Search first to check the record does not already exist under another spelling.**
- 3 **Create the new record and complete every field that has a value.**
- 4 **Save.**
- 5 **Check where the record now appears.**

A new category shows up in the product screens immediately; a bad one is visible to everyone just as fast.

IMPORTANT

Duplicates are the main way master data goes wrong — 'Cement 32.5N' and 'CEMENT 32.5 N' become two products, two stock balances and two sets of reports. Always search before you create.

12

Accounting configuration

Where to find it: [Accounting Configuration](#)

Set up the accounting backbone that transactions will post against.

The screens

- Chart of Accounts — the ledger structure. Accounts define where transactions post; balances come from postings, never typed in.
- Tax Codes — the codes applied to sales and purchase documents, and the control account each posts to.
- Payment Methods — the tender types available at the till and on supplier payments.
- Bank & Cash Accounts — where money is held, each linked to a ledger account.
- Currencies — the currencies available across sales, procurement and accounting.
- Financial Periods — the accounting calendar, controlling when transactions may be posted or backdated.

IMPORTANT

Closing a financial period stops postings into it. Close periods only once you are certain everything for that period is in — reopening is an exception, not a routine.

13

Reports

Where to find it: [Reports & Analytics > Reports](#)

Produce the operational numbers management asks for, without building spreadsheets by hand.

Produce a report

- 1 **Open Reports & Analytics > Reports.**
- 2 **Choose the tab you need.**
Headcount, leave, payroll, compliance, attendance and training are each their own tab.
- 3 **Set the date range and any department or branch filter.**
- 4 **Export the table to CSV for further analysis, or download the whole tab as a branded PDF for circulation.**

TIP

Send the PDF when the numbers are final and the CSV when someone is going to work on them.

14

Getting help

Know who to ask when something does not work or does not look right.

Who to contact

Problem	Who to ask
Cannot sign in, account locked or suspended	Your administrator
Wrong personal details, department or job title	HR
Attendance record is wrong	Submit a correction on Attendance, then HR
Leave balance looks wrong	HR
Payslip, deduction or payment query	Finance, via a payment request on My Payslip
A menu item you need is missing	Your supervisor, who will ask an administrator
Something on screen looks broken	Your supervisor or administrator, with a screenshot

Before you report a problem

- Note the exact screen you were on and the exact wording of any red message.
- Take a screenshot — it saves a long explanation.
- Try once more; a lost network connection is the most common cause of a failed save.

TIP

The system keeps working when your connection drops — actions are queued and sent when you are back online. Do not repeat an action many times because it looked slow.
